

Sandbox – Test Handelsbanken’s PSD2 Payment Initiation API

This document provides you with access tokens so you can test out our PSD2 Payment Initiation API in our Sandbox. We’ve got a variety of payment types per customer and country that can be tested.

General information

The payment responses and information in the Sandbox environment are as identical as possible to the calls in the Live environment, and the static mocked test data for the Sandbox is based on what gives most value for the developer.

The Payment API contains three endpoints (POST, PUT and GET) that give different responses. The endpoints are built up by payment products that differ between countries.

The Authorization requests and responses can be run separately or linked together to build a complete payment flow from the Client Credential Grant to Get Payment status.

The responses are identified by the different objects in the header, body or as query parameters.

The header and path information in the Sandbox environment is designed so that the same objects are in the live environment. The country in the header information will determine the country-specific response.

API test data

The test data responses in the Sandbox environment consist of static data based on different payment scenarios grouped by payment product. The request data needed for a payment product is documented in the Technical Guidelines.

Payment Test Scenarios

The Payment API consists of three endpoints and the payment flow is detailed in the Technical Guidelines for Payments. The Payment Initiation use the Client Credential Grant Access Token. Whereas the Payment Execution call (PUT Payment) uses the Authorization Code Grant Access Token since the payment flow requires that the Payment Initiation is authenticated by the PSU prior to the Payment Execution call. The Payment status call can be requested using both the Client Credential Grant Access Token and the Authorization Code Grant Access Token.

The Transaction status in the response for Payment Execution and Payment status call assumes that the payment is successful and complete.

In order to receive the correct response, the values in the tables below must be included in the header or path objects.

Table of contents

1. AUTHORIZATION FLOW SCENARIOS FOR PAYMENTS	3
1.1 TEST SCENARIOS FOR CLIENT CREDENTIAL GRANT	3
1.2 EXAMPLE TEST SCENARIO FOR PAYMENT INITIATION	3
1.3 TEST SCENARIOS FOR INITIATE AUTHORIZATION USING REDIRECT (OAUTH 2)	3
1.4 TEST SCENARIOS FOR AUTHORIZATION CODE GRANT	4
1.5 EXAMPLE TEST SCENARIO FOR PAYMENT EXECUTE.....	4
2. PAYMENT SCENARIOS FOR SWEDEN	5
2.1 SWEDISH-DOMESTIC-GIRO-PAYMENT	5

3.3 CROSS-CURRENCY-CREDIT-TRANSFER	11
4. PAYMENT SCENARIOS FOR FINLAND	12
4.1 SEPA-CREDIT-TRANSFER	12
4.2 CROSS-CURRENCY-CREDIT-TRANSFER	12
5. PAYMENT SCENARIOS FOR THE NETHERLANDS	14
5.1 SEPA-CREDIT-TRANSFER	14
5.2 CROSS-CURRENCY-CREDIT-TRANSFER	14

1. Authorization flow scenarios for payments

This section describes the complete payment flow from an enrolled TPP’s perspective. Only one Payment product is used in this description. The authorization flows are with a redirect (oauth2) solution and with a decoupled solution using Mobile BankID for Swedish PSUs. The Client Credential Grant step is identical for both redirect and decoupled authorization.

1.1 Test scenarios for Client Credential Grant

The test data in the Sandbox for Client Credential Grant request and responses is identified using the scope object. The Client Credential Grant is identical for all countries and is PSU independent. Detailed documentation of the endpoint can be found in the API documentation.

Country	Scenario	Scope	grant_type
All	Client Credential Grant	PIS	client_credentials

1.2 Example test scenario for Payment initiation

Ind / Corp	Scenario	Authorization with type Bearer
Individual	swedish-domestic-giro-payment	QVQ6YmNIZjI0M2QtZDBhZi00OGZiLWE0OTgtZGUwMTJhMDdjMjYx

1.3 Test scenarios for Initiate Authorization using redirect (OAuth 2)

The test data in the Sandbox for Initiate Authorization using redirect (OAuth 2) requests and response is identified by the scope object. Initiate Authorization using redirect is identical for all countries in the Sandbox solution. This request is sent using a PSU browser in the Live environment. The state object is used to identify the PSU relation in the response. Detailed documentation of the endpoint can be found in the API documentation.

Country	Scenario	Scope	redirect_uri
All	Initiate Authorization using redirect	PIS:58cdfef9-7f6e-476e-a1af-c54c0a9a3135	Decided by the TPP. Must be set in order to receive Authorization token.

1.4 Test scenarios for Authorization Code Grant

The test data in the Sandbox for Authorization Code Grant request and responses is identified by the grant_type and code objects. The Authorization Code Grant is identical for all countries. Detailed documentation of the endpoint can be found in the API documentation.

Country	Scenario	grant_type	Code
All	Authorization Code Grant	authorization_token	eaaa392c-dd26-485f-8ea2-3538ccba928a

1.5 Example test scenario for Payment execute

Ind / Corp	Scenario	Authorization with type Bearer	Payment ID
